Boston, MA | (443) 939-4325 | colin.ef.stanton@gmail.com | [linkedin.com/in/cfstanton](https://www.linkedin.com/in/cfstanton) | [col.in](https://colin.stanton.com)

Motivated Product Engineer with a proven track record of supporting complex software systems in industries with rigorous regulatory requirements. Passionate about building development pipelines that enable developers to iterate quickly, providing actionable feedback while ensuring security and engineering standards are met. Experienced in developing efficient, extendable, and secure CI/CD pipelines to support organizations in the cloud and in datacenters. I believe AI is an evolving landscape with the potential for truly transformative impact on the development lifecycle. Looking to bring my unique perspective to new and interesting problems!

Technical Skills

Languages: Java, Python, Groovy/SpringBoot, React, Bash, Ruby, JavaScript, Perl

Technologies: AWS, Jenkins, Artifactory, Jira/Trello, ELK, Grafana, Ansible, Neo4j

Development Tools: Linux, Git, Visual Studio, Vim, Claude, Codex

Work Experience

athenahealth | Senior Software Engineer

2025 to 2026

Clinical Application Development: My time as a product manager reaffirmed my passion for software engineering and I moved back to an IC role in one of the customer facing teams that I had previously supported. Before being laid off, I had the opportunity to rotate through two feature teams, and while I am proud to have delivered feature enhancements to actual clinical providers, the most impactful learning was the perspective it gave me as a DevOps engineer. It let me experience just how impactful small points of friction can be in the development process, and how easy they are to miss or dismiss without consistent customer engagement.

AI Adoption: Worked with an org-wide group of developers working to integrate AI into our product and SDLC, while ensuring we met the high standards of data stewardship required for healthcare companies. I personally created skills, MCP servers, and AI-supported development tools for VSCode. These tools worked together to reduce the amount of exploratory investigation the AI needs prior to implementation. This meant fewer tokens were wasted, and the AI could start working sooner, reducing friction and saving money.

athenahealth | Product Manager

2023 to 2025

Business Critical SCM: Created roadmaps and established metrics to drive improvements to the athenahealth's source control tooling (Bitbucket and Perforce). Coordinated a zero-downtime migration of Perforce to a new datacenter ensuring we were in the new location with ample buffer.

Modern Managed Deployment Pipeline: Onboarded six Alpha teams to a managed Kubernetes deployment pipeline, successfully demonstrating the viability of a standardized approach and improving DORA metrics for the teams involved. Concurrently, I helped define our long-term strategy and directed evaluations of off-the-shelf software that could better serve our needs while reducing our overall budget. These evaluations enabled us to incorporate informational security gating mechanisms into our pipeline early on, setting best-practice expectations for our customers and exposing points of friction before they could affect the developers.

athenahealth | Senior Associate Product Manager

2022 to 2023

Feature Velocity Improvements: Extended the work I had done as Scrum Master, establishing metrics to track unplanned support work. This data allowed me to demonstrate the impact our overly broad portfolio was having on our team's feature delivery. By effectively communicating this to leadership I was able to advocate for an org structure that enabled us to focus on improving customer outcomes, ultimately reducing the proportion of the release spent on unplanned maintenance and customer requests from over 67% of to just under 34%.

CI/CD Pipeline for Low-Latency-Microservices: By improving the team's bandwidth we were able take a leading role in designing and developing a CI/CD pipeline to enabling low-latency connections between Kubernetes and the application databases. As Product Manager I coordinated with multiple stakeholders across the company to ensure our solution worked for the developers and fit into the larger roadmap. We were able to go from zero to production in under a year, unlocking the development freedom of a microservice paradigm for athenahealth while maintaining the low-latency expected from our developers.

athenahealth | Senior Software Engineer

2019 to 2022

Standardization of SDLC: Maintained Jenkins libraries that enabled developers to safely, reliably, and efficiently test and deploy microservices as well as the infrastructure that the services depend on. Coordinated with security and cloud teams to develop an SDLC that reduced the complexity of deploying services to AWS. Security and architectural guardrails built into the libraries helped surface issues early in the development process, speeding up the development process. Further extended these libraries to support Blue/Green deployments, ensuring that athenahealth's services maintained their uptime metrics.

Team Leadership: Acted as Scrum Master, driving Agile best practices and refining sprint retrospectives to capture an accurate picture of team performance. This helped identify hurdles impacting our ability to deliver value, which in turn allowed our EM and PO to advocate for portfolio and organization structures that would enable greater focus. Coached more junior developers, helping them onboard to the team's codebase and ensuring they were getting the support they needed to advance their engineering skills as well as their careers.

athenahealth | Software Engineer

2017 to 2018

IaaS: Expanded my understanding and technical knowledge of Infrastructure as a Service best-practices. Developed puppet modules to standardize the creation and management of on-premise servers. Leveraged a Ruby-based DSL called Sparkleformation to create AWS templates that could be reused across the company, ensuring that IaaS best-practices were being leveraged by default.

Intuit | Software Engineer

2012 to 2016

Traffic Management Tool Development: Led a team to develop a Ruby on Rails based traffic management tool. This tool replaced the F5 interface with a more streamlined user experience that reduced the operational complexity of switching traffic. This allowed us to prevent common user errors as well as reduce the overall time it took to switch traffic.

Cloud Migration: Successfully migrated TurboTax's E-File engine to AWS. This is a high-volume service that validates all Tax Filings before transmitting them to the IRS. This business-critical service was migrated with zero downtime, ensuring continuity and uptime for all of TurboTax's millions of users.

Deployment Solutions: Created integration and deployment solutions in Jenkins and Chef, ensuring safe and repeatable deployments to AWS.

Security Reporting Tool: Worked with security teams to understand and implement best practices for cloud application security. Implemented SSO and improved login behavior for an internal tool to make it easier for our developers to support the customer.

Education

Northeastern University – *Bachelor of Science in Computer Science & Digital Art* – 2013
